Spring Framework

웹 프로그램 설계모델

- 1. 웹프로그래밍 설계모델
- 2. 스프링 프레임워크 설계모델
- 3. DispatcherServlet 설정
- 4. Controller @Controller
- 5. Controller @RequestMapping
- 6. Controller Model 타입 파라미터
- 7. View객체
- 8. 전체 웹프로그램 구조

1. 웹프로그래밍 설계모델

Model1

1. 웹 프로그래밍을 구축하기 위한 설계 모델

Model2

2: 스프링 MVC플레임워크 설계 구조

3: DispatcherServlet 설정

web.xml에 서블릿을매핑

WEB-INF폴더의 web.xml파일 만들고, <servlet>태그와 <servlet-mapping>태그를 이용한다.

<servlet>

<servlet-name>서블릿 별칭</servlet-name>

<servlet-class>서블릿명(패키지 이름을 포함한 전체서블릿명)</servlet-class>

</servlet>

<servlet-mapping>

<servlet-name>서블릿별칭</servlet-name>

<url-pattern>/맵핑명</url-pattern>

</servlet-mapping>

<servlet>

<servlet-name>appServlet</servlet-name>

<servlet-class>org.springframework.web.servlet.DispatcherServlet/servlet-class>

<init-param>

<param-name>contextConfigLocation</param-name>

<param-value>/WEB-INF/spring/appServlet/servlet-context.xml</param-value>

</init-param>

<la><load-on-startup>1</load-on-startup>

</servlet>

<servlet-mapping>

<servlet-name>appServlet</servlet-name>

<url-pattern>/</url-pattern>

</servlet-mapping>

3: DispatcherServlet 설정

초기화 파라미터에서 스프링 설정 파일을 지정하지 않은 경우 서블릿별칭을 이용해서 스프링 컨테미너 생성

ViewResolver

HandlerMapping

DispatcherServlet

appServlet-context,xml 이용한

스프링 컨테이너

HandlerAdapter

4:@Controller

5: @RequestMapping

6: Model 타입의 파라미터

```
@RequestMapping("/success")
public String success(Model model) {

model.setAttribute("tempData", "model has data!!");
```

- 개발자는 Model 객체에 데이터를 담아서 DispatcherServlet에 전달할 수 있다.
- DispatcherServler에 전달된 Model데이터는 View에서 가공되어클라이언트한테 응답처리 된다.

7: View 객체

```
<beans:bean class="org.springframework.web.servlet.view.InternalResourceViewResolver">
  <beans:property name="prefix" value="/WEB-INF/views/"/>
 <beans:property name="suffix" value=".jsp" />
 </beans:bean>
 @RequestMapping("/success")
 public String success(Model model) {
    return "success";
 <beans:bean class=\overline{\text{org.springframework.web.servlet.view.InternalResourceViewResolver}}</pre>
     <beans:property hame="prefix" value="/WEB-INF/views/" />
     <beans:property name="suffix" value=".jsp"/>
 </beans:bean>
JSP파일명:/WEB-INF/views/success.jsp
JSP파일명 = return String값 + prefix값 + suffix값
```

8: 전체적인 웹프로그래밍 구조
